

Mites associated with some medicinal plants (Asteraceae) in Hamedan, Iran

Farshad Masoudian and Mohammad Khanjani*

Department of Plant Protection, College of Agriculture, Bu Ali-Sina University, Hamadan, Iran.

Abstract: Medicinal plants have been used from the past to present. Different small arthropods such as Acari were found on these plants. Therefore a study on the Acari fauna associated with some medicinal plants (Family: Asteraceae) in Hamedan region was carried out during 2008–2009. In this survey, 23 species belonging to 18 genera from 15 different families of the subclass Acari were collected and identified. Two spotted spider mite (*Tetranychus urticae* Koch) was determined as an abundant phytophagous mite species in this study.

Keywords: fauna, mites, phytophagous, predator, medicinal plants.

Introduction

Hamadan province, western Iran, is the place where the value of medicinal plants was first discovered. The Bu Ali Sina medicinal plants garden and nursery is located in Hamedan. This garden has many visitors from all over the world every year. Three hundred and ninety four (394) species of medicinal plants are grown in Hamedan province (Kalvandi *et al.*, 2007) among which the Asteraceae is one the most diverse families that hosts various arthropods *e.g.* phytophagous, ectoparasitic and predatory mites. Phytophagous mites, especially tetranychids, can damage medicinal plants. Gupta and Karmakar (2010) reported the Tetranychidae as major pests of medicinal plants in India and *Tetranychus urticae* Koch was regarded by them as a new threat to these plants in the country (Sharma and Agarwal 2010). The present survey was conducted because our

knowledge on the fauna of mites on medicinal plants in Iran is fragmentary and was also aimed at the identification of predatory mites with the potential to manage phytophagous mites and small insect pests on medicinal plants.

Materials and Methods

The mites were collected from the foliage and other parts of medicinal plants of the family Asteraceae (shaking over a white tray). The specimens were mounted on microscope slides in Hoyer's medium. All specimens were examined under an Olympus BX51 microscope (DIC). A map indicating sampling locations is provided (Figure 1). All specimens were collected by F. Masoudian; the collected and identified slide specimens were deposited in the Mite Collection of the Acarology Laboratory, University of Bu-Ali Sina, Hamedan, Iran.

Discussion

According to this study a few species were phytophagous but most species were effective agents in natural equilibrium to the extent that in their presence there would be no need for chemical control. Among the plant feeder mites two spotted spider mite, *T. urticae* was most widely distributed with high populations in certain locations. No considerable damage was noticed on the host plants because the predatory mites are effective in reduction of its population. There is a great diversity of predatory mites on the medicinal plants yet the Phytoseiidae family members play the major role (Masoudian, 2011) as good potential biological control agents.

Acknowledgements

We thank Prof. Edward A. Ueckermann (ARC-Plant Protection Research Institute, Private Bag X134, Queenswood, Pretoria, 0121 South Africa) for critical review of the manuscript and supplying some literature review, and his valuable comments.

دریافت: ۲۸ بهمن ۱۳۹۱؛ پذیرش: ۲۸ فروردین ۱۳۹۲

چکیده: گیاهان دارویی از دیرباز تاکنون همواره مورد استفاده قرار می‌گیرند. روی این گروه از گیاهان، بندپایانی همچون کنه‌ها یافت می‌شود. در این مطالعه، فون کنه‌های مرتبط با برخی از گیاهان دارویی (خانواده Asteraceae) در منطقه همدان در طول دوره سال‌های ۲۰۰۸ تا ۲۰۰۹ مورد بررسی قرار گرفت. طی آن ۲۳ گونه (۱۸ جنس از ۱۵ خانواده) از کنه‌ها (زیراسته پیش‌استیگمايان و راسته میان-استیگمايان) جمع‌آوری و شناسایی شد. در این مطالعه، کنه تارتان دولکهای (*Tetranychus urticae* Koch) به عنوان کنه گیاهخوار به میزان بیشتری جمع‌آوری شد.

واژگان کلیدی: فون، کنه، گیاهخوار، شکارگر، گیاهان دارویی
